**Fig. 1: Microscopic observation of disaggregated primary human xenograft tumor cells after transfection of a red-labeled siRNA (siGLO at 20nM) with Viomer® BLUE**  
*(Disaggregated tumors form mass of stem cells and many others)*

*“Note that almost every liposome we tried was either too toxic, killed the very fragile disaggregated tumour cells and were remarkably inefficient at siRNA transfer (e.g nanofectin)!”*

Data from N. Maitland, University of York (UK)
